1. Introduction. Let $\mathcal{M}_0$ [resp. $\mathcal{M}_1$] be a coarse moduli space of rank 2 semistable vector bundles of even [resp. odd] degree with fixed determinant on a smooth projective curve $X$. The Picard group is infinite cyclic. Let $L$ be the ample generator. The dimension of a vector space $H^0(\mathcal{M}_i, L^m)$ $(i = 0, 1)$ is given by the Verlinde formula. For small $m > 0$, the meaning of this dimension can be explained in the framework of algebraic geometry. For example, we have

$$\dim H^0(\mathcal{M}_0, L) = 2^g,$$

where $g$ is the genus of $X$. On the otherhand, we have

$$\dim H^0(\text{Jac}(X), \mathcal{O}(2\Theta)) = 2^g.$$  

In fact we have a natural isomorphism between these two vector spaces (See [1]). In [2], the meaning of the two equations

$$\dim H^0(\mathcal{M}_0, L^2) = 2^{g-1}(2^g + 1)$$
$$\dim H^0(\mathcal{M}_1, L) = 2^{g-1}(2^g - 1)$$

are clarified. The above dimensions are the number of even or odd theta characteristics on $X$. Beauville associated to an even [resp. odd] theta characteristic $\kappa$ a divisor $D_\kappa$ on $\mathcal{M}_0$ [resp. $\mathcal{M}_1$] that can be described from a moduli-theoretic viewpoint, and proved that they form a basis of $H^0(\mathcal{M}_0, L^2)$ [resp. $H^0(\mathcal{M}_1, L)$]. In [13], two vector spaces $H^0(\mathcal{M}_0, L^1)$ and $H^0(\mathcal{M}_1, L^2)$ are considered. In [15], Pauly deals with a parabolic case.

The purpose of this paper is to carry out a similar study for a moduli space $\overline{\mathcal{M}}_{\text{Par}}(\mathbb{P}^1; I)$ of rank 2 semistable parabolic vector bundles with half weights of degree zero on $\mathbb{P}^1$.

To be more precise, by Verlinde formula, we have

$$\dim H^0(\overline{\mathcal{M}}_{\text{Par}}(\mathbb{P}^1; I), K_{\overline{\mathcal{M}}_{\text{Par}}(\mathbb{P}^1; I)}^{-1}) = \frac{2^{2g+1} + 1}{3}$$

for $I = \{x_1, \ldots, x_{2g+2}\}$, and

$$\dim H^0(\overline{\mathcal{M}}_{\text{Par}}(\mathbb{P}^1; I), K_{\overline{\mathcal{M}}_{\text{Par}}(\mathbb{P}^1; I)}^{-1}) = \frac{2^{2g} - 1}{3}$$

for $I = \{x_1, \ldots, x_{2g+1}\}$. Let us consider the case when $|I|$ is even. Let $C$ be the hyperelliptic curve whose branch locus is $I$. By a result of Bhosle in [4], $\overline{\mathcal{M}}_{\text{Par}}(\mathbb{P}^1; I)$ is isomorphic to a moduli space $\overline{\mathcal{M}}_{C/\mathbb{P}^1}$ of rank 2 semistable vector bundles endowed with an involution action with trivial determinant. On $\overline{\mathcal{M}}_{C/\mathbb{P}^1}$, we shall find as many
effective anticanonical divisors as the dimension of $H^0(\mathcal{M}^{Par}(\mathbb{P}^1; I), K^{-1}_{\mathcal{M}^{Par}(\mathbb{P}^1; I)})$ that are described moduli-theoretically, and shall prove that they form a basis of $H^0(\mathcal{M}^{inv}_{C/\mathbb{P}^1}, K^{-1}_{\mathcal{M}^{inv}_{C/\mathbb{P}^1}})$ (Theorem 3.4). In Section 4, we investigate a relation between these divisors and those divisors constructed by Beauville (Theorem 4.1, 4.2). It would be desirable that the divisors constructed on $\mathcal{M}^{inv}_{C/\mathbb{P}^1}$ in Section 3 are defined set-theoretically. So we shall prove the reducedness of these divisors in Section 5.

After submitting this paper, the author has succeeded in some generalization of some results of this paper to the case of algebraic curves of arbitrary genus.

**Notation.**
- In this paper, all schemes are of finite type over $\mathbb{C}$.
- If a group $G = \langle g | g^2 = e \rangle \simeq \mathbb{Z}/2\mathbb{Z}$ acts on a coherent sheaf $F$ on a scheme $X$, $F^+$ [resp. $F^-$] stands for the $g$-invariant [resp. $(-g)$-invariant] subsheaf of $F$. For a vector space $V$ acted on by $G$, we define $V^+$ and $V^-$ similarly. $\chi(F)^+$ means $\sum(-1)^iH^i(X,F)^+$.
- If $E$ is a locally free sheaf, $\mathcal{E}nd^0(E)$ is a sheaf of traceless endomorphisms.
- $p_X, p_Y, p_Z$ etc. stand for projections to the factors $X, Y, Z$ etc..

**2. Preliminaries.** Let $X$ be a smooth irreducible projective curve over $\mathbb{C}$ and $I$ a non-empty finite set of points of $X$. Let $E$ be a vector bundle on $X$.

**Definition 2.1.** A parabolic structure on $E$ is giving, at each point $x \in I$, a filtration $E_x = F_1(E)_x \supset \cdots \supset F_{n_i(E)}(E)_x \supset F_{n_i(E)+1}(E)_x = 0$ and a sequence of real numbers, called parabolic weights, $0 \leq a_1(x) < \cdots < a_{n_i(E)}(x) < 1$. The parabolic degree of $E$, denoted by $\text{pardeg}(E)$, is defined by

$$\text{pardeg}(E) := \deg E + \sum_{x \in I} \sum_{i=1}^{n_i(E)} a_i(x) \left( \dim F_i(E)_x - \dim F_{i+1}(E)_x \right)$$

**2.2.** Let $E'$ be a subbundle of a parabolic vector bundle $E$. We can equip $E'$ with the canonical parabolic structure: the filtration of $E'$ consists of the distinct ones of $\{ E'_x \cap F_i(E)_x \}$, and the parabolic weight $a'_i(x)$ of $E'$ is given by $a'_i(x) = a_i(x)$, where $i$ is the biggest integer satisfying $F'_i(E')_x = E'_x \cap F_i(E)_x$.

**Definition 2.3.** A parabolic vector bundle $E$ is said to be semistable [resp. stable] if for any subbundle $E'$ of $E$ with $0 < \text{rank } E' < \text{rank } E$, we have

$$\frac{\text{pardeg } E'}{\text{rank } E'} \leq \frac{\text{pardeg } E}{\text{rank } E}$$

[resp.<],

where $E'$ is equipped with the canonical parabolic structure.

**2.4.** In this paper, we are concerned with only rank 2 parabolic bundles of parabolic weights $(0, \frac{1}{2})$ at each $x \in I$. Let $\mathcal{M}^{Par}(X; I)$ [resp. $\mathcal{M}^{Par}(X; I)$] be the coarse moduli space of semistable [resp. stable] rank 2 parabolic vector bundles with trivial determinant of parabolic weights $(0, \frac{1}{2})$ at each point $x \in I$.

**2.5.** Given a family of parabolic rank 2 vector bundles with trivial determinant of weight $(0, \frac{1}{2})$ at each point $x \in I$ parametrized by a scheme $S$, i.e. a rank 2 vector bundle $\mathcal{E}$ on $S \times X$ such that $\text{det } \mathcal{E}$ is a pull-back of a line bundle on $S$ and a surjection $\mathcal{E}|_{S \times \{x\}} \to \mathcal{Q}_x$ for each $x \in I$, where $\mathcal{Q}_x$ is a line bundle on $S \times \{x\}$ such that, for any
s ∈ S, E |\imath\rangle is parabolic vector bundle of parabolic weight \((0, \frac{1}{2})\) at each point \(x \in I\), we denote the line bundle \((\det Rp_{S,X}E)^{−2} \otimes (\det E |_{S \times \{y\}})^{[1(1−g)−|I|]}\) by \(\Xi_E\), where \(g\) is the genus of \(X\) and \(y\) is a point of \(X\) and \(E':=\Ker(E \to \bigoplus_{x \in I} Q|_{S \times \{x\}})\).

In [14] Pauly proved the following theorem.

**Theorem 2.6.** There exists a unique line bundle \(\Xi\) on \(\mathcal{M}^{\text{Par}}(X; I)\) such that for any family of semistable rank 2 parabolic vector bundles \(E\) with trivial determinant of weight \((0, \frac{1}{2})\) at each point \(x \in I\) parametrized by a scheme \(S\), \(f^*\Xi \simeq \Xi_E\), where \(f\) is the natural morphism \(f : S \to \mathcal{M}^{\text{Par}}(X; I)\). Moreover \(\Xi\) is ample.

**Proposition 2.7.** Let \(\Xi\) be as above. Then \(\Xi|_{\mathcal{M}^{\text{Par}}(X; I)} \simeq K_{\mathcal{M}^{\text{Par}}(X; I)}^{-1}\).

**Proof.** Recall that \(\mathcal{M}^{\text{Par}}(X; I)\) is constructed as a geometric quotient of a smooth variety \(R^s\) by a \(\text{PGL}\)-action, where \(R^s\) is an open subscheme of a \(\mathbb{P}^1 \times \cdots \times \mathbb{P}^1\)-bundle over an open subset of a quot scheme. Note that the quotient map \(\pi : R^s \to \mathcal{M}^{\text{Par}}(X; I)\) is a principal \(\text{PGL}\)-bundle. In order to prove the proposition, we have to prove that \(\pi^*K_{\mathcal{M}^{\text{Par}}(X; I)}\) and \(\Xi\) are isomorphic as \(\text{PGL}\)-linearized line bundles on \(R^s\), where \(E\) is the universal parabolic bundle on \(R^s \times X\). By Lemma 2.8 of [5], it suffices to prove that \(\pi^*K_{\mathcal{M}^{\text{Par}}(X; I)}\) and \(\Xi\) are isomorphic as line bundles. Since \(\pi^*K_{\mathcal{M}^{\text{Par}}(X; I)} \simeq R^1p_*(\text{End}(E' \subset E))\), where \(E \text{ End}(E' \subset E)\) is a sheaf of traceless endomorphism preserving \(E' := \Ker(E \to \bigoplus_{x \in I} Q|_{S \times \{x\}})\), we need to prove that \(\det R^1p_*(\text{End}(E' \subset E)) \simeq (\det R^1p_*(E'))^{-2} \otimes (\det R^1p_*(\text{End}(E'))^{-2} \otimes (\det E |_{S \times \{y\}})^{4(1−g)−|I|})\), where \(p\) is the projection \(R^s \times C \to R^s\). A calculation using Riemann-Roch theorem implies that \(\det R^1p_*(\text{End}(E' \subset E))\) and \(\det R^1p_*(E')^{-2} \otimes (\det R^1p_*(\text{End}(E'))^{-2} \otimes (\det E |_{S \times \{y\}})^{4(1−g)−|I|})\) are isomorphic modulo torsion. Using Theorem 2.3 of [5], we know \(\det R^1p_*(\text{End}(E' \subset E))\) also descends to \(\mathcal{M}^{\text{Par}}(X; I)\). Therefore the proof will be completed if we prove \(\text{Pic}(\mathcal{M}^{\text{Par}}(X; I))\) is torsion-free. This follows from the next lemma. 

**Lemma 2.8.** \(\text{Pic}(\mathcal{M}^{\text{Par}}(X; I))\) is torsion-free.

**Proof.** Since \(\mathcal{M}^{\text{Par}}(X; I)\) is a GIT quotient of a smooth variety, it has rational singularities by [10]. On top of that, the canonical divisor of \(\mathcal{M}^{\text{Par}}(X; I)\) is Cartier, hence its canonical singularities by Corollary 5.24 of [9]. Since \(K_{\mathcal{M}^{\text{Par}}(X; I)}\) is ample, we have \(H^i(\mathcal{M}^{\text{Par}}(X; I), O_{\mathcal{M}^{\text{Par}}(X; I)}) = 0\) for any \(i > 0\) by Theorem 1-2-5 in [8]. Given a finite étale morphism \(f : Y \to \mathcal{M}^{\text{Par}}(X; I)\), we also have \(H^i(Y, O_Y) = 0\) for any \(i > 0\). Since \(1 = H^0(Y, O_Y) = \chi(O_Y) = \deg f(\mathcal{O}_{\mathcal{M}^{\text{Par}}(X; I)}) = \deg f \dim H^0(\mathcal{M}^{\text{Par}}(X; I), O_{\mathcal{M}^{\text{Par}}(X; I)}) = \deg f\), \(f\) is an isomorphism. This proves the torsion-freeness of \(\text{Pic}(\mathcal{M}^{\text{Par}}(X; I))\).

**Remark 2.9.** Lemma 2.8 also follows from the description of the Picard group of a moduli stack of quasi-parabolic bundles given in [11]. See also [15].

2.10. From now on throughout this paper, we treat the case when \(X = \mathbb{P}^1\). When \(I = \{x_1, \ldots, x_{2g+2}\}\), put \(B := I\). When \(I = \{x_1, \ldots, x_{2g+1}\}\), put \(B := I \cup \{x_{2g+2}\}\), where \(x_{2g+2}\) is a point of \(X - I\). Let \(\pi : C \to X = \mathbb{P}^1\) be the hyperelliptic curve of genus \(g\) whose branch points are \(B\). Let \(i : C \to C\) be the involution and put \(\{e_i\} := \pi^{-1}(x_j)\). These notations are used throughout this paper.
**Definition 2.11.** An involutional vector bundle on \( C \) is a vector bundle \( F \) on \( C \) endowed with an \( i \)-action, i.e., an isomorphism \( \alpha : i^* F \to F \) such that \( \alpha \circ i^* \alpha \) is the identity. An involutional vector bundle \( F \) is said to be involutionally semistable [resp. involutionally stable] if for any \( i \)-invariant subbundle \( G \) with \( 0 < \text{rank} G < \text{rank} F \) the inequality \( \deg G/\text{rank} G \leq \deg F/\text{rank} F \) [resp. \( \deg G/\text{rank} G < \deg F/\text{rank} F \)] holds.

**Remark 2.12.** An involutional vector bundle is involutionally semistable if and only if it is semistable as a vector bundle.

2.13. When \( I \) is even, we denote by \( \overline{\mathcal{M}}_{C/P^1}^{\text{inv}} \) [resp. \( \mathcal{M}_{C/P^1}^{\text{inv}} \)] the coarse moduli space of rank 2 involutionally semistable [resp. involutionally stable] involutional vector bundles on \( C \) with trivial determinant such that the eigen values of the \( i \)-action on the fiber over \( c_j \) are 1 and -1 for \( 1 \leq j \leq 2g+2 \).

When \( I \) is odd, we denote by \( \overline{\mathcal{M}}_{C/P^1}^{\text{inv}} \) [resp. \( \mathcal{M}_{C/P^1}^{\text{inv}} \)] the coarse moduli space of rank 2 involutionally semistable [resp. involutionally stable] involutional vector bundles on \( C \) with determinant \( O(e_{2g+2}) \) such that the eigen values of the \( i \)-action on the fiber over \( c_j \) are 1 and -1 for \( 1 \leq j \leq 2g+1 \) and 1 with multiplicity two for \( j = 2g+2 \) and when \( g \) is even.

Let \( (E, \{E_{x_j} = F_1(E)_{x_j} \supset F_2(E)_{x_j}\}) \) be an element of \( \overline{\mathcal{M}}^\text{par}(\mathbb{P}^1; I) \). When \( |I| \) is even [resp. odd], put \( \tilde{\mathcal{E}} := \ker(\pi^* E \to \oplus_{j=1}^{2g+2} F_1(E)_{x_j}/F_2(E)_{x_j}) \) [resp. \( \tilde{\mathcal{E}} := \ker(\pi^* E \to \oplus_{j=1}^{2g+2} F_1(E)_{x_j}/F_2(E)_{x_j}) \)], where the morphism \( \pi^* E \to F_1(E)_{x_j}/F_2(E)_{x_j} \) is given by \( \pi^* E \to \pi^* E \otimes \mathcal{C}_{x_j} \simeq E \otimes \mathcal{C}_{x_j} \to F_1(E)_{x_j}/F_2(E)_{x_j} \). We endow \( \tilde{\mathcal{E}} \) with the natural \( i \)-action. Then by Proposition 1.2 of [4], we obtain an isomorphism between \( \overline{\mathcal{M}}^\text{par}(\mathbb{P}^1; I) \) and \( \overline{\mathcal{M}}^{\text{inv}}_{C/P^1} \), taking \( (E, \{E_{x_j} = F_1(E)_{x_j} \supset F_2(E)_{x_j}\}) \) to \( \tilde{\mathcal{E}} \otimes \mathcal{O}_C((g+1)c_{2g+2}), \) where \( \mathcal{O}_C((g+1)c_{2g+2}) \) is given the natural \( i \)-action.

3. A basis of anticanonical sections. In the rest of this paper, we assume that \( g \geq 2 \) mainly because we want the codimension of the locus of non-stable bundles in the moduli to be greater than one.

3.1. In Section 2, we saw that, for \( I = \{x_1, \ldots, x_{2g+2}\} \) or \( \{x_1, \ldots, x_{2g+1}\} \), \( \overline{\mathcal{M}}^\text{par}(\mathbb{P}^1; I) \) and \( \overline{\mathcal{M}}^{\text{inv}}_{C/P^1} \) are isomorphic. Since \( \text{codim}(\overline{\mathcal{M}}^\text{par}(\mathbb{P}^1; I) \setminus \overline{\mathcal{M}}^{\text{par}}(\mathbb{P}^1; I), \overline{\mathcal{M}}^{\text{inv}}_{C/P^1}) \geq 2 \), Proposition 2.7 implies that the canonical divisor of \( \overline{\mathcal{M}}^\text{par}(\mathbb{P}^1; I) \) is a Cartier divisor and that \( \Xi \simeq K^{-1}_{\overline{\mathcal{M}}^\text{par}(\mathbb{P}^1; I)} \). We have isomorphisms of vector spaces

\[
H^0(\overline{\mathcal{M}}^{\text{inv}}_{C/P^1}, K^{-1}_{\overline{\mathcal{M}}^{\text{par}}_{C/P^1}}) \simeq H^0(\overline{\mathcal{M}}^\text{par}(\mathbb{P}^1; I), K^{-1}_{\overline{\mathcal{M}}^\text{par}(\mathbb{P}^1; I)})
\]

\[
\simeq H^0(\overline{\mathcal{M}}^\text{par}(\mathbb{P}^1; I), \Xi).
\]

By Verlinde formula (cf.[3]), the dimension of these vector spaces is \( \frac{2g^{2}+1}{3} \) if \( |I| \) is even, and \( \frac{2g^{2}+1}{3} \) if \( |I| \) is odd. Our goal in this section is to find a basis of \( H^0(\overline{\mathcal{M}}^{\text{inv}}_{C/P^1}, K^{-1}_{\overline{\mathcal{M}}^{\text{par}}_{C/P^1}}) \). We define \( S^\text{even} \) and \( S^\text{odd} \) to be the sets given by

\[
S^\text{even} := \{ (\mathfrak{A}, \lambda) \in 2^{\{c_1, \ldots, c_{2g+1}\}} \times \mathbb{Z} \mid 4|\mathfrak{A}| + 3\lambda = 4g - 2 \}
\]

and
\[
S^{\text{odd}} := \left\{ (\mathfrak{A}, \lambda) \in 2^{(c_1, \ldots, c_{2g+1})} \times \mathbb{Z} \left| \begin{array}{l} |\mathfrak{A}| \leq g - 1 \\ 4|\mathfrak{A}| + 3\lambda = 4g - 4 \end{array} \right. \right\}.
\]

3.2. Let \( \mathcal{F} \) be a family of involutinal vector bundles on \( C \) parameterized by an irreducible scheme \( S \). If \( \chi(\mathcal{F}_{s}) = 0 \) for any \( s \in S \) and \( H^0(C, \mathcal{F}_{s}) = 0 \) for general \( s \in S \), then we can construct an effective divisor denoted by \( \text{Div}(R^1p_{S*}(\mathcal{F})^+) \) whose support is \( \{ s \in S | H^0(C, \mathcal{F}_{s})^+ \neq 0 \} \): for any \( s \in S \) we can find a resolution \( 0 \rightarrow \mathcal{O}_U(\varphi_{ij}) \rightarrow R^1p_{S*}(\mathcal{F})^+ \rightarrow 0 \) in a neighborhood \( U \) of \( s \), then on \( U \) \( \text{Div}(R^1p_{S*}(\mathcal{F})^+) \) is defined by the equation \( \text{det}(\varphi_{ij}) = 0 \).

Recall that \( \mathcal{M}_{C/P^1}^{\text{inv}} \) is constructed as a geometric quotient of a smooth irreducible variety \( Z \) by an action of a reductive algebraic group \( G \) of the form \( GL(a_1) \times GL(a_2)/\{(tI, tI) | t \in G_m \} \), where \( Z \) is an open subscheme of an equivariant quot scheme with trivial determinant. Let \( \mathcal{O}_{Z \times C}(-N) \otimes V \rightarrow Q \rightarrow 0 \) be the universal quotient, where \( \mathcal{O}_{Z \times C}(-N) \otimes V \) and \( Q \) have an \( i \)-action. For \( (\mathfrak{A}, \lambda) \) in \( S^{\text{even}} \) or \( S^{\text{odd}} \), we have the divisor \( \text{Div}(R^1p_{Z*}(\text{End}^F(Q) \otimes p_C^*\mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})^+)) \) on \( Z \) by 3.2. By construction, it is \( G \)-invariant, hence it is a pullback of a divisor, say \( D_{(\mathfrak{A}, \lambda)}^\circ \), on \( \mathcal{M}_{C/P^1}^{\text{inv}} \).

**Lemma 3.3.** We have an isomorphism \( \mathcal{O}_{\mathcal{M}^{\text{inv}}_{C/P^1}}(D_{(\mathfrak{A}, \lambda)}^\circ) \simeq K_{\mathcal{M}^{\text{inv}}_{C/P^1}}^{-1} \).

**Proof.** We have to prove that the two line bundles \( \text{det}(R^1p_{Z*}(\text{End}^F(Q)^+) \otimes \mathcal{O}_{Z \times C}(\mathfrak{A} + \lambda c_{2g+2})^+) \) and \( \mathcal{O}_Z(\text{Div}(R^1p_{Z*}(\text{End}^F(Q) \otimes p_C^*\mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})^+))) \) are isomorphic as \( G \)-linearized line bundles. We can check that

\[
\mathcal{O}_Z(\text{Div}(R^1p_{Z*}(\text{End}^F(Q) \otimes p_C^*\mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})^+)) = \text{det}(R^1p_{Z*}(\text{End}^F(Q)^+) \otimes \mathcal{O}_{Z \times C}(\mathfrak{A} + \lambda c_{2g+2})^+) \]

as \( G \)-linearized line bundles. Since \( \otimes_{c_j \in \mathfrak{A}} \left( \text{det} \left( \text{End}^F(Q)^+ \big|_{Z \times \{c_{j+1}\}} \right) \right)^{-\frac{1}{2}} \) is trivial as a \( G \)-linearized line bundle, the lemma is proved. \( \square \)

Since \( \mathcal{M}^{\text{inv}}_{C/P^1} \simeq K_{\mathcal{M}^{\text{par}}(X; I)} \) and \( K_{\mathcal{M}^{\text{par}}(X; I)} \) is a Cartier divisor by Proposition 2.7, \( K_{\mathcal{M}^{\text{inv}}_{C/P^1}} \) is also a Cartier divisor. Since \( \text{codim}(\mathcal{M}^{\text{inv}}_{C/P^1} \setminus \mathcal{M}^{\text{par}}_{C/P^1}, \mathcal{M}^{\text{inv}}_{C/P^1}) \geq 2 \), \( D_{(\mathfrak{A}, \lambda)}^\circ \) extends uniquely to an effective divisor, denoted by \( D_{(\mathfrak{A}, \lambda)} \), on \( \mathcal{M}_{C/P^1} \). Now we can state the main theorem of this section.

**Theorem 3.4.** If \( |I| \) is even [resp. odd], \( \{ D_{(\mathfrak{A}, \lambda)} \}_{(\mathfrak{A}, \lambda) \in \mathfrak{S}^{\text{even}}} \) [resp. \( \{ D_{(\mathfrak{A}, \lambda)} \}_{(\mathfrak{A}, \lambda) \in \mathfrak{S}^{\text{odd}}} \) is a basis of \( H^0(\mathcal{M}_{C/P^1}, K_{\mathcal{M}_{C/P^1}}^{-1}) \).

We give a proof only for the case when \( |I| \) is even. The following lemmas in this section are valid only for this case. The proof of the case when \( |I| \) is odd is similar.
We follow closely the proof given in [2]

3.5. Let $\mathcal{F}$ be a family of involutonally stable involutional vector bundles with trivial determinant on $C$ parameterized by a scheme by $S$. Then we have a natural map $\varphi : S \to M_{C,i \over 2}^{inv}$. We have $\chi(E nd^p(\mathcal{F} \mid_{s \times C}) \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^+ = 0$ for any $s \in S$ and any $(\mathfrak{A}, \lambda) \in S^{even}$. Assume that $S$ is irreducible and that $H^0(E nd^p(\mathcal{F} \mid_{s \times C}) \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^+ = 0$ for general $s \in S$. By the construction of $D(\mathfrak{A}, \lambda)$, we have $\text{Div}(R^1p_* \mathcal{E} nd^p(\mathcal{F}) \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^+ = \varphi^*D(\mathfrak{A}, \lambda)$ as effective divisors on $S$.

Let $\mathcal{P}$ be a Poincaré line bundle on $\text{Jac}(C) \times C$. Since $\mathcal{P} \oplus (1 \times i)^*\mathcal{P}$ has a natural $i$-action, it is a family of rank 2 involutonal vector bundles with trivial determinant on $C$ parameterized by $\text{Jac}(C)$.

**Lemma 3.6.**

(i) $P \oplus i^*P$ is involutonally semistable for any $P \in \text{Jac}(C)$

(ii) For $P \in \text{Jac}(C)$, $P \oplus i^*P$ is not involutonally stable if and only if $P \in \text{Jac}(C)[2]$, where $\text{Jac}(C)[2]$ is the subgroup of $\text{Jac}(C)$ consisting of 2-torsion points.

**Proof.** (i) is obvious by Remark2.12. If $P \in \text{Jac}(C)[2]$, $P$ and $i^*P$ are isomorphic. We can find an isomorphism $\alpha : P \to i^*P$ such that the composite of $\alpha$ and $i^*\alpha : i^*P \to i^*P \simeq P$ is the identity. Then $(1, \alpha) : P \mapsto P \oplus i^*P$ is an $i$-invariant line subbundle. Since $\deg P = 0$, $P \oplus i^*P$ is not involutonally stable. Conversely, if $P \oplus i^*P$ is not involutonal stable, we can find an $i$-invariant line subbundle $A$ of $P \oplus i^*P$ with $\deg A = 0$. Since $A \simeq i^*A, A \in \text{Jac}(C)[2]$. The inclusion $A \hookrightarrow P \oplus i^*P$ gives rise to an isomorphism $A \simeq P$ of $A \simeq i^*P$. Hence $P \in \text{Jac}(C)[2]$.

3.7. By Lemma 3.6, $\mathcal{P} \oplus i^*\mathcal{P}$ gives rise to the natural morphism $\varphi : \text{Jac}(C) \to M_{C,i \over 2}^{inv}$.

**Lemma 3.8.** Take $(\mathfrak{A}, \lambda) \in S^{even}$.

(i) If $|\mathfrak{A}| \neq g + 1$, then $H^0(C, E nd^p(L \oplus i^*L) \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^+ \neq 0$ for any $L \in \text{Jac}(C)$.

(ii) If $|\mathfrak{A}| = g + 1$, then $H^0(C, E nd^p(L \oplus i^*L) \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^+ = 0$ for general $L \in \text{Jac}(C)$ and $\varphi^*D(\mathfrak{A}, \lambda c_{2g+2}) = 2\text{Jac}T_{(\mathfrak{A}, \lambda)}$, where $\Theta$ is the theta divisor on $\text{Jac}(C)^{g-1}$ and $2\text{Jac}(\text{Jac}(C) \to \text{Jac}(C))$ is given by $L \mapsto L^{g/2}$ and $T_{(\mathfrak{A}, \lambda)} : \text{Jac}(C) \to \text{Jac}(C)^{g-1}$ is given by $L \mapsto L \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})$.

**Proof.** For $E = L \oplus i^*L$, where $L \in \text{Jac}(C)$ and $E$ is endowed with the natural $i$-action, $E nd^p(E)$ is isomorphic to $\mathcal{O}_C \oplus ((L^{-1} \otimes i^*L) \oplus (i^*L^{-1} \otimes L))$, where $i$ acts on $\mathcal{O}_C$ by $(-1)$ multiplication and on $(L^{-1} \otimes i^*L) \oplus (i^*L^{-1} \otimes L)$ by $i^* ((L^{-1} \otimes i^*L) \oplus (i^*L^{-1} \otimes L)) \simeq (i^*L^{-1} \otimes L) \oplus (L^{-1} \otimes i^*L) \otimes (L^{-1} \otimes i^*L)$.

Hence we have $H^0(C, E nd^p(L \oplus i^*L) \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^+ \simeq H^0(C, O(\mathfrak{A} + \lambda c_{2g+2})^+ \otimes H^0(C, i^*L^{-1} \otimes L \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})).$ If $|\mathfrak{A}| < g + 1$, then $\deg i^*L^{-1} \otimes L \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}) > g - 1$, hence $H^0(C, i^*L^{-1} \otimes L \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})) = 0$. Since $\dim H^0(C, O(\mathfrak{A} + \lambda c_{2g+2})) = \max\{\frac{-2}{\lambda}, 0\}$, if $|\mathfrak{A}| > g + 1$, then $\dim H^0(C, O(\mathfrak{A} + \lambda c_{2g+2})) = 0$. These prove (i).

If $|\mathfrak{A}| = g + 1$, then $\dim H^0(C, O(\mathfrak{A} + \lambda c_{2g+2}))^+ = 0$ and $H^0(C, i^*L^{-1} \otimes L \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})) = 0$ for general $L \in \text{Jac}(C)$ because $\deg i^*L^{-1} \otimes L \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}) = g - 1$. This implies the former statement of (ii). Since we are assuming that $g \geq 2$, in order to prove the latter statement of (ii), it suffices to see that $\varphi^*D(\mathfrak{A}, \lambda c_{2g+2}) = \ldots$
2i_{ac} T^{*\alpha}_{\lambda,\lambda} \Theta over Jac(C) \setminus Jac(C)[2]. Over Jac(C) \setminus Jac(C)[2], \mathcal{P} \oplus i^*\mathcal{P} gives a family of involutionally stable involutional vector bundles, hence we have \varphi^*D_{\lambda,\lambda} = \text{Div}(R^1p_{Jac(C)\setminus Jac(C)}[2](\mathcal{E} nd(P \oplus i^*\mathcal{P}) \otimes p_{C}\mathcal{O}(\mathbf{A} + \lambda c_{2g+2}))) by 3.5. As above \text{Div}(R^1p_{Jac(C)\setminus Jac(C)}[2](\mathcal{E} nd(P \oplus i^*\mathcal{P}) \otimes p_{C}\mathcal{O}(\mathbf{A} + \lambda c_{2g+2}))^+) \simeq R^1p_{Jac(C)\setminus Jac(C)}[2](i^*\mathcal{P} \otimes p_{C}\mathcal{O}(\mathbf{A} + \lambda c_{2g+2})). The latter statement follows from this. □

We define the set \( T \) by

\[ T := \left\{ \mathcal{E} \subseteq \{c_1, \ldots, c_{2g+2}\} \mid \mathcal{E} \text{ is even, } \mathcal{E} \neq \emptyset \right\}. \]

Since \( \mathcal{O}(\mathcal{C} - \mathcal{E}[c_{2g+2}] \in Jac(C)[2] \) for any \( \mathcal{C} \in T \), from this we can construct an étale double cover \( \pi_\mathcal{E} : C_\mathcal{E} \to C \). Moreover, since \( \mathcal{O}(\mathcal{C} - \mathcal{E}[c_{2g+2}] \) has the natural \( i \)-action, we get an involution \( i_\mathcal{E} : C_\mathcal{E} \to C_\mathcal{E} \) such that \( \pi_\mathcal{E} \circ i_\mathcal{E} = i \circ \pi_\mathcal{E} \). By \( h_\mathcal{E} : C_\mathcal{E} \to C_\mathcal{E}/i_\mathcal{E} \) we mean the quotient of \( C_\mathcal{E} \) by this involution. There is a unique map \( q_\mathcal{E} : C_\mathcal{E}/i_\mathcal{E} \to \mathbb{P}^1 \) such that \( q_\mathcal{E} \circ h_\mathcal{E} = \pi = \pi_\mathcal{E} \).

The branch locus of \( q_\mathcal{E} \) is \( p(\mathcal{C}) \) and the genus of \( C_\mathcal{E}/i_\mathcal{E} \) is \( \frac{g \mathcal{C}}{2} - 1 \). Put \( \left\{ c_\mathcal{E}^e, c_\mathcal{E}^i \right\} := \pi^{-1}(c_j) \). For \( N \in \text{Jac}(C_\mathcal{E}/i_\mathcal{E}) \), the line bundle \( h_{\mathcal{E}}^*(N) \otimes \mathcal{O}\left(\sum c_\mathcal{E}^i\mathcal{E}^e c_j\right) \otimes \mathcal{O}(2g+2-|\mathcal{E}|c_{2g+2}) \) on \( C_\mathcal{E} \) has the natural \( i_\mathcal{E} \)-action, which induces an \( i \)-action on \( \pi_\mathcal{E}(h_{\mathcal{E}}^*(N) \otimes \mathcal{O}\left(\sum c_\mathcal{E}^i\mathcal{E}^e c_j\right) \otimes \mathcal{O}(2g+2-|\mathcal{E}|c_{2g+2}) \). Note that \( \det\left(\pi_\mathcal{E}(h_{\mathcal{E}}^*(N) \otimes \mathcal{O}\left(\sum c_\mathcal{E}^i\mathcal{E}^e c_j\right) \otimes \mathcal{O}(2g+2-|\mathcal{E}|c_{2g+2}) \right) \simeq \mathcal{O}_C \) and the eigen values of the \( i \)-action on the fiber of \( \pi_\mathcal{E}(h_{\mathcal{E}}^*(N) \otimes \mathcal{O}\left(\sum c_\mathcal{E}^i\mathcal{E}^e c_j\right) \otimes \mathcal{O}(2g+2-|\mathcal{E}|c_{2g+2}) \) over every \( c_j \) are 1 and \(-1 \).

**Lemma 3.9.** The above involutional vector bundle \( \pi_\mathcal{E}(h_{\mathcal{E}}^*(N) \otimes \mathcal{O}\left(\sum c_\mathcal{E}^i\mathcal{E}^e c_j\right) \otimes \mathcal{O}(2g+2-|\mathcal{E}|c_{2g+2}) \) is involutionally stable.

**Proof.** Given a line subbundle \( L \subset \pi_\mathcal{E}(h_{\mathcal{E}}^*(N) \otimes \mathcal{O}\left(\sum c_\mathcal{E}^i\mathcal{E}^e c_j\right) \otimes \mathcal{O}(2g+2-|\mathcal{E}|c_{2g+2}) \), we have a nonzero homomorphism \( \pi^{-1}_\mathcal{E} L \to h_{\mathcal{E}}^*(N) \otimes \mathcal{O}\left(\sum c_\mathcal{E}^i\mathcal{E}^e c_j\right) \otimes \mathcal{O}(2g+2-|\mathcal{E}|c_{2g+2}) \). Since \( \text{deg } h_{\mathcal{E}}^*(N) \otimes \mathcal{O}\left(\sum c_\mathcal{E}^i\mathcal{E}^e c_j\right) \otimes \mathcal{O}(2g+2-|\mathcal{E}|c_{2g+2}) \) = 0, we have \( \text{deg } L \leq 0 \), which implies the semistability of \( \pi_\mathcal{E}(h_{\mathcal{E}}^*(N) \otimes \mathcal{O}(2g+2-|\mathcal{E}|c_{2g+2}) \).

Suppose that the above \( L \) is \( i \)-invariant and of degree zero. Then there exists a subset \( U \) of \( \{c_1, \ldots, c_{2g+2}\} \) with \( |U| \) such that \( L \) is isomorphic to \( \mathcal{O}(\sum c_\mathcal{E}^i\mathcal{E}^e c_j - |U|c_{2g+2}) \) as involutional bundles. Then \( h_{\mathcal{E}}^*(N) \otimes \mathcal{O}\left(\sum c_\mathcal{E}^i\mathcal{E}^e c_j \right) \otimes \mathcal{O}(2g+2-|U|c_{2g+2}) \otimes \mathcal{O}_C\left(\sum c_\mathcal{E}^i\mathcal{E}^e c_j : c_{2g+2} \right) \) is a trivial line bundle with
a trivial \( i_\mathfrak{e} \)-action. For \( c_j \notin (\mathfrak{E} \cup \{c_{2g+2}\}) \), however, either \( c_j^\mathfrak{e} \) or \( c_j^{1\mathfrak{e}} \) appears with an odd multiplicity. This means that the above line bundle cannot be trivial as an involutonal bundle.

3.10. Let \( \mathcal{P}_\mathfrak{e} \) be a Poincaré line bundle on \( \text{Jac}(C/\mathfrak{e}) \times C/\mathfrak{e} \). By Lemma 3.9, \((1 \times \pi_\mathfrak{e}) \left( (1 \times h_\mathfrak{e})^* \mathcal{P}_\mathfrak{e} \otimes p_\mathfrak{e}^* \mathcal{O}(- \sum_{c_j \notin \mathfrak{E}} c_j^\mathfrak{e}) \right) \otimes p_\mathfrak{e}^* \mathcal{O}(\frac{2g+2-|\mathfrak{E}|}{2}c_{2g+2}) \) is a family of involutonally stable involutonal vector bundles with trivial determinant, hence gives rise to a natural map \( \varphi_\mathfrak{e} : \text{Jac}(C/\mathfrak{e}) \to \mathcal{M}_{\text{tor}(\mathfrak{E})/\mathcal{B}_1} \subset \mathcal{M}_{\text{tor}(\mathfrak{E})/\mathcal{B}_1} \).

**Lemma 3.11.** Take \( (\mathfrak{A}, \lambda) \in \mathcal{S}_{\text{even}} \).

(i) If \( 2|\mathfrak{A} \cap \mathfrak{E}| + \lambda - |\mathfrak{E}| + 2 \neq 0 \), then

\[
H^0 \left( C, \text{End}^\mathfrak{e} \left( \pi_\mathfrak{e}^* \left( h_\mathfrak{e}^*(N) \otimes \mathcal{O}( - \sum_{c_j \notin \mathfrak{E}} c_j^\mathfrak{e} ) \right) \right) \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}) \right) \neq 0
\]

for any \( N \in \text{Jac}(C/\mathfrak{e}) \).

(ii) If \( 2|\mathfrak{A} \cap \mathfrak{E}| + \lambda - |\mathfrak{E}| + 2 = 0 \), then

\[
H^0 \left( C, \text{End}^\mathfrak{e} \left( \pi_\mathfrak{e}^* \left( h_\mathfrak{e}^*(N) \otimes \mathcal{O}( - \sum_{c_j \notin \mathfrak{E}} c_j^\mathfrak{e} ) \right) \right) \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}) \right) = 0
\]

for general \( N \in \text{Jac}(C/\mathfrak{e}) \), and we have

\[
\varphi_\mathfrak{e}^*(D(\mathfrak{A}, \lambda)) = 2\text{Jac}(C/\mathfrak{e})^{-1} \left( T_\tau((\mathfrak{A}, \lambda); \mathfrak{E}) \right), \text{ where } \Theta \text{ is the theta divisor on } \text{Jac}(C/\mathfrak{e}) \frac{|\mathfrak{E}| - 2}{2},
\]

where \( T_\tau((\mathfrak{A}, \lambda); \mathfrak{E}) : \text{Jac}(C/\mathfrak{e}) \to \text{Jac}(C/\mathfrak{e}) \) is defined by \( L \mapsto L^{\otimes 2} \) and \( \tau(\mathfrak{A}, \lambda) \mathfrak{E} : \text{Jac}(C/\mathfrak{e}) \to \text{Jac}(C/\mathfrak{e}) \frac{|\mathfrak{E}| - 2}{2} \text{ by } L \mapsto \tau((\mathfrak{A}, \lambda); \mathfrak{E}) \), here

\[
\tau((\mathfrak{A}, \lambda), \mathfrak{E}) := \mathcal{O} \left( 2 \sum_{c_j \in \mathfrak{E} \setminus \mathfrak{A}} h_\mathfrak{e}(c_j^\mathfrak{e}) + \sum_{c_j \notin \mathfrak{E}} c_j \right) \mathcal{O}( \frac{|\mathfrak{E}|}{2} \right) \left( h_\mathfrak{e}(c_{2g+2}^\mathfrak{e}) + h_\mathfrak{e}(\mathfrak{E}^\mathfrak{e}) \right).
\]

**Proof.** On \( C_\mathfrak{e} \), we have the exact sequence

\[
0 \to h_\mathfrak{e}^*(N^{-1}) \otimes \mathcal{O} \left( - \sum_{c_j \in \mathfrak{E}} (c_j^\mathfrak{e} + c_j^{1\mathfrak{e}}) - \sum_{c_j \notin \mathfrak{E}} c_j^{1\mathfrak{e}} + |\mathfrak{E}|(c_{2g+2}^\mathfrak{e} + c_{2g+2}) \right)
\]

\[
\to \pi_\mathfrak{e}^* \pi_\mathfrak{e}^* \left( h_\mathfrak{e}^*(N) \otimes \mathcal{O}( - \sum_{c_j \notin \mathfrak{E}} c_j^\mathfrak{e} ) \right) \to h_\mathfrak{e}^*(N) \otimes \mathcal{O}( - \sum_{c_j \notin \mathfrak{E}} c_j^\mathfrak{e} ) \to 0.
\]

From this, we have the exact sequence on \( C \),

\[
0 \to \mathcal{O}(\mathfrak{A} + \mathfrak{E} + (\lambda - |\mathfrak{E}|)c_{2g+2})
\]

\[
\to \mathcal{E} \otimes \left( \pi_\mathfrak{e}^* \left( h_\mathfrak{e}^*(N) \otimes \mathcal{O}( - \sum_{c_j \notin \mathfrak{E}} c_j^\mathfrak{e} ) \right) \right) \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})
\]

\[
\to \pi_\mathfrak{e}^* \left( h_\mathfrak{e}^*(N^2) \otimes Q \right) \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}) \to 0,
\]

where

\[
Q := \mathcal{O}_\mathfrak{e} \left( \sum_{c_j \in \mathfrak{E}} (c_j^\mathfrak{e} + c_j^{1\mathfrak{e}}) + \sum_{c_j \notin \mathfrak{E}} (c_j^{1\mathfrak{e}} - c_j^\mathfrak{e}) - |\mathfrak{E}|(c_{2g+2}^\mathfrak{e} + c_{2g+2}) \right).
\]
This gives rise to the long exact sequence
\[
0 \to H^0 (C, O(\mathfrak{A} + \mathcal{E} + (\lambda - |\mathcal{E}|)c_{2g+2}))^+ \\
\to H^0 (C, \mathcal{E}nd^p \left( \pi_{\mathfrak{A}*} \left( h^*_\mathcal{E}(N) \otimes O(- \sum_{c_j \notin \mathcal{E}} c_j^\mathcal{E}) \right) \right) \otimes O(\mathfrak{A} + \lambda c_{2g+2}))^+ \\
\to H^0 (C, \mathcal{E}nd^p \left( \pi_{\mathfrak{A}*} \left( h^*_\mathcal{E}(N^2) \otimes Q \right) \otimes O(\mathfrak{A} + \lambda c_{2g+2}) \right) \\
\to H^1 (C, O(\mathfrak{A} + \mathcal{E} + (\lambda - |\mathcal{E}|)c_{2g+2}))^+ \to \ldots
\]
Since \( \dim H^0 (C, O(\mathfrak{A} + \mathcal{E} + (\lambda - |\mathcal{E}|)c_{2g+2}))^+ = \max \{ 0, (2|\mathfrak{A} \cap \mathcal{E}| + \lambda - |\mathcal{E}| + 2)/2 \} \), we have
\[
H^0 \left( C, \mathcal{E}nd^p \left( \pi_{\mathfrak{A}*} \left( h^*_\mathcal{E}(N) \otimes O(- \sum_{c_j \notin \mathcal{E}} c_j^\mathcal{E}) \right) \right) \otimes O(\mathfrak{A} + \lambda c_{2g+2}) \right)^+ \neq 0
\]
for any \( N \in \text{Jac}(C_{\mathcal{E}/i\mathcal{E}}) \) if \( 2|\mathfrak{A} \cap \mathcal{E}| + \lambda - |\mathcal{E}| + 2 > 0 \). If \( 2|\mathfrak{A} \cap \mathcal{E}| + \lambda - |\mathcal{E}| + 2 < 0 \), applying the above argument to \( K_C \otimes O(\mathfrak{A} + \lambda c_{2g+2})^{-1} \) in place of \( O(\mathfrak{A} + \lambda c_{2g+2}) \) and using Serre duality, we obtain
\[
H^1 \left( C, \mathcal{E}nd^p \left( \pi_{\mathfrak{A}*} \left( h^*_\mathcal{E}(N) \otimes O(- \sum_{c_j \notin \mathcal{E}} c_j^\mathcal{E}) \right) \right) \otimes O(\mathfrak{A} + \lambda c_{2g+2}) \right)^+ \neq 0
\]
for any \( N \in \text{Jac}(C_{\mathcal{E}/i\mathcal{E}}) \). Since
\[
\chi \left( \mathcal{E}nd^p \left( \pi_{\mathfrak{A}*} \left( h^*_\mathcal{E}(N) \otimes O(- \sum_{c_j \notin \mathcal{E}} c_j^\mathcal{E}) \right) \right) \otimes O(\mathfrak{A} + \lambda c_{2g+2}) \right)^+ = 0,
\]
this proves (1).

Suppose that \( 2|\mathfrak{A} \cap \mathcal{E}| + \lambda - |\mathcal{E}| + 2 = 0 \). Then \( H^0 (C, O(\mathfrak{A} + \mathcal{E} + (\lambda - |\mathcal{E}|)c_{2g+2}))^+ = 0 \). Since \( \chi(O(\mathfrak{A} + \mathcal{E} + (\lambda - |\mathcal{E}|)c_{2g+2}))^+ = (2|\mathfrak{A} \cap \mathcal{E}| + \lambda - |\mathcal{E}| + 2)/2 = 0 \), \( H^1 (C, O(\mathfrak{A} + \mathcal{E} + (\lambda - |\mathcal{E}|)c_{2g+2}))^+ \) also vanishes. We obtain isomorphisms
\[
H^0 \left( C, \mathcal{E}nd^p \left( \pi_{\mathfrak{A}*} \left( h^*_\mathcal{E}(N) \otimes O(- \sum_{c_j \notin \mathcal{E}} c_j^\mathcal{E}) \right) \right) \otimes O(\mathfrak{A} + \lambda c_{2g+2}) \right)^+ \\
\cong H^0 \left( C, \pi_{\mathfrak{A}*} \left( h^*_\mathcal{E}(N^2) \otimes Q \right) \otimes O(\mathfrak{A} + \lambda c_{2g+2}) \right)^+ \\
\cong H^0 \left( C, h^*_\mathcal{E}(N^2) \otimes O \left( 2 \sum_{c_j \notin \mathcal{E} \cap \mathfrak{A}} (c_j^\mathcal{E} + c_j^\mathfrak{A}) + 2 \sum_{c_j \notin \mathcal{E} \cap \mathfrak{A}} c_j^\mathfrak{E} \\
+ \sum_{c_j \notin \mathcal{E} \cap \mathfrak{A}} (c_j^\mathcal{E} + c_j^\mathfrak{A}) + \sum_{c_j \notin \mathcal{E} \cap \mathfrak{A}} (c_j^\mathcal{E} - c_j^\mathfrak{E}) + (\lambda - |\mathcal{E}|)(c_j^\mathcal{E} + c_j^\mathfrak{A}) \right) \\
\cong H^0 \left( C, \mathfrak{E} \cap i\mathcal{E}, N \otimes O \left( 2 \sum_{c_j \notin \mathcal{E} \cap \mathfrak{A}} h(e_j^\mathfrak{E}) + \sum_{c_j \notin \mathcal{E} \cap \mathfrak{A}} h(e_j^\mathfrak{E}) \right) \\
+ \sum_{c_j \notin \mathcal{E} \cap \mathfrak{A}} h(e_j^\mathfrak{E}) - \sum_{c_j \notin \mathcal{E} \cap \mathfrak{A}} h(e_j^\mathfrak{E}) + \frac{\lambda - |\mathcal{E}|}{2} \left( h(e_j^\mathfrak{E} + c_j^\mathfrak{E}) \right) \right) \right) +
\]
Therefore, \( H^0 \left( C, \mathcal{E}nd^p \left( \pi_{\mathfrak{A}*} \left( h^*_\mathcal{E}(N) \otimes O(- \sum_{c_j \notin \mathcal{E}} c_j^\mathcal{E}) \right) \right) \otimes O(\mathfrak{A} + \lambda c_{2g+2}) \right)^+ \neq 0 \) if and only if \( H^0 (C_{\mathfrak{E}/i\mathcal{E}}, N \otimes \tau ((\mathfrak{E}, \lambda); \mathcal{E})) \neq 0 \). This proves that, set-theoretically, \( \varphi^*_C (D_{(\mathfrak{E}, \lambda)}) = 2^*_{\text{Jac}(C_{\mathfrak{E}/i\mathcal{E}})} \left( T^*_\tau ((\mathfrak{E}, \lambda); \mathcal{E}) \right) \). The proof that this holds scheme-theoretically is similar to the counterpart in the proof of Lemma3.8. □
Lemma 3 of Chapter VIII of [6]. Thus
\[
\sum_{(\alpha, \lambda) \in \mathcal{S}^{even}} a(\alpha, \lambda) D_{(\epsilon, \lambda)} = 0
\]
for \( a(\alpha, \lambda) \in \mathbb{C} \). Pulling back this equation to \( \text{Jac}(C) \) by \( \varphi \) in 3.7, we obtain \( \sum_{|\alpha| = g+1} a(\alpha, \lambda) \left( 2_{\text{Jac}(C)}^* \Theta \right) = 0 \) by Lemma 3.8.

\[\left\{ 2_{\text{Jac}(C)}^* \Theta \right\}_{\text{theta characteristics}} \]
are linearly independent by Proposition A.8 of [2]. \( \{ \mathcal{O}(\alpha + \lambda)_{g+2} \}_{|\alpha| = g+1} \) is a subset of the set of theta characteristics of \( C \) by Lemma 3 of Chapter VIII of [6]. Thus \( a(\alpha, \lambda) = 0 \) if \( |\alpha| = g+1 \). Fix \( (\alpha_0, \lambda_0) \in \mathcal{S}^{even} \) with \( |\alpha_0| < g+1 \). We choose an element \( \epsilon \in \mathcal{T} \) such that \( \alpha_0 \subset \mathcal{C} \) and \( c_{2g+2} \in \mathcal{C} \) and \( |\epsilon| = 2|\alpha_0| + \lambda_0 + 2 \). Pulling back \( (\bullet) \) to \( \text{Jac}(C \epsilon) \) by \( \varphi \) of 3.10, we obtain
\[
\sum_{2|\alpha \cap \epsilon| + \lambda + 2 = |\epsilon|} a(\alpha, \lambda) 2_{\text{Jac}(C \epsilon)}^* T^*_{\tau((\alpha, \lambda); \epsilon)} \Theta = 0
\]
by Lemma 3.11. For \((\alpha, \lambda), (\lambda', \lambda') \in \mathcal{S}^{even} \) such that \( 2|\alpha \cap \epsilon| + \lambda + 2 = |\epsilon| \) and \( 2|\alpha' \cap \epsilon| + \lambda' + 2 = |\epsilon| \),
\[
\tau((\alpha, \lambda), \epsilon) \otimes \tau((\lambda', \lambda'), \epsilon)^{-1} \simeq \mathcal{O}_{C \epsilon} \langle c \rangle \left( \sum_{c_j \in \mathcal{C} \cap I \epsilon} h_\epsilon (c_j^\epsilon) - \sum_{c_j \in \mathcal{C} \cap I \epsilon'} h_\epsilon (c_j^\epsilon') \right) + (\lambda - \lambda' + 2|\alpha \setminus (\epsilon \cup \alpha')| - 2|\alpha' \setminus (\epsilon \cup \alpha)|) h_\epsilon (c_{2g+2}^\epsilon)
\]
CLAIM. If \( \tau((\alpha_0, \lambda_0); \epsilon) \simeq \tau((\alpha, \lambda); \epsilon) \), then \((\alpha_0, \lambda_0) = (\alpha, \lambda) \).

Proof. [Proof of Claim] If \( \tau((\alpha_0, \lambda_0); \epsilon) \simeq \tau((\alpha, \lambda); \epsilon) \), we have \( \mathcal{C} \cap \alpha_0 = \mathcal{C} \cap \alpha \) or \( \mathcal{C} \cap \alpha_0 = \mathcal{C} \setminus \{c_{2g+2}\} \). If \( \mathcal{C} \cap \alpha_0 = \mathcal{C} \cap \alpha \), we get \( \lambda = \lambda_0 \). Hence \( |\alpha_0| = |\alpha| \). Since \( \alpha_0 = \mathcal{C} \cap \alpha_0 = \mathcal{C} \cap \mathcal{C} \subset \alpha \), we have \( \alpha_0 = \alpha \). Let us prove that \( \mathcal{C} \cap \alpha_0 = \mathcal{C} \setminus \{c_{2g+2}\} \) does not occur. If it did occur, we have \( \lambda = -\lambda_0 - 2 \). Since \( \lambda + \lambda_0 \equiv 0 \mod 4 \), we obtain a contradiction. \( \square \)

Taking account of the above claim and the fact that \( \tau((\alpha, \lambda), \epsilon) \otimes \tau((\lambda', \lambda'), \epsilon)^{-1} \) is a 2-torsion point of \( \text{Jac}(C \epsilon) \), we have \( a(\alpha_0, \lambda_0) = 0 \) again by Proposition A.8 of [2]. For \((\alpha_0, \lambda_0) \in \mathcal{S}^{even} \) with \( |\alpha_0| > g+1 \), we choose an element \( \epsilon \in \mathcal{T} \) such that \( \{c_1, \ldots, c_{2g+2}\} \setminus \alpha_0 \subset \mathcal{C} \) and \( c_{2g+2} \in \mathcal{C} \) and \( |\epsilon| = 4g + 2 - \lambda_0 + 2|\alpha_0| \). Then a similar argument as above implies that \( a(\alpha_0, \lambda_0) = 0 \). \( \square \)

4. Relation with Beauville’s basis. By Remark 2.12, we have a natural homomorphism \( f : \overline{\mathcal{M}}_{C/\mathbb{P}^1} \rightarrow \overline{\mathcal{M}}(2, \mathcal{O}_C) \) when \(|I|\) is even, and \( f : \overline{\mathcal{M}}_{C/\mathbb{P}^1} \rightarrow \overline{\mathcal{M}}(2, \mathcal{O}_C(c_{2g+2})) \) when \(|I|\) is odd, where \( \overline{\mathcal{M}}(2, \mathcal{O}_C) \) [resp. \( \overline{\mathcal{M}}(2, \mathcal{O}_C(c_{2g+2})) \)] is the coarse moduli space of rank 2 semistable vector bundles with the determinant \( \mathcal{O}_C \) [resp. \( \mathcal{O}_C(c_{2g+2}) \)]. In this section, we compare the basis \( \{ D_\lambda(\alpha, \lambda) \}_{(\alpha, \lambda) \in \mathcal{S}^{even}} \) [resp. \( \{ D_\lambda(\alpha, \lambda) \}_{(\alpha, \lambda) \in \mathcal{S}^{odd}} \)] of \( H^0(\overline{\mathcal{M}}_{C/\mathbb{P}^1}, K_{\overline{\mathcal{M}}_{C/\mathbb{P}^1}}^{-\frac{1}{2}}) \) with the basis \( \{ D_\lambda \}_K \) of even theta characteristic of \( C \) of \( H^0(\overline{\mathcal{M}}(2, \mathcal{O}_C), K_{\overline{\mathcal{M}}(2, \mathcal{O}_C)}^{-\frac{1}{2}}) \) [resp.
\{D_\kappa\}_{\kappa \text{-odd}} \text{theta characteristic of } C \text{ of } H^0(M(2,OC(c_{2g+2})), K_{M(2,OC(c_{2g+2}))}^2). \text{ Here } D_\kappa \text{ is the divisor constructed by Beauville in [2]. It is the unique effective divisor that satisfies the relation } 2D_\kappa = \text{Div}(R_\kappa(\text{End}_E(E) \otimes p_C^*\kappa)) \text{ over the stable locus of the moduli space, where } E \text{ is the universal vector bundle and } p \text{ is the projection to the moduli space. (See [2] for details.)}

Put
\[ V := \{ V \subset \{c_1, \ldots, c_{2g+2}\} \mid |V| \equiv g + 1(\text{mod } 2) \}. \]

The map from \( V \) to the set of theta characteristics of \( C \) that sends \( V \) to \( OC(V + (g - 1 - |V|)c_{2g+2}) \) is a bijection. We have
\[ \dim H^0(C, OC(V + (g - 1 - |V|)c_{2g+2})) = \frac{|g + 1 - |V||}{2}. \]

**Theorem 4.1.** Assume that \( |I| \) is even. Let \( \kappa \) be an even theta characteristic of \( C \), say \( OC(V + (g - 1 - |V|)c_{2g+2}) \).
1. If \( H^0(C, \kappa) = 0 \), i.e. \( |V| = g + 1 \), then \( f^*D_\kappa = D_{V(2)} \).
2. If \( H^0(C, \kappa) \neq 0 \), i.e. \( |V| \neq g + 1 \), then \( f^*D_\kappa = 0 \).

**Theorem 4.2.** Assume that \( |I| \) is odd. Let \( \kappa \) be an odd theta characteristic of \( C \), say \( OC(V + (g - 1 - |V|)c_{2g+2}) \).
1. If \( |V| = g - 1 \), then \( f^*D_\kappa = D_{V(0)} \).
2. If \( |V| \neq g - 1 \), then \( f^*D_\kappa = 0 \).

We give a proof only for Theorem 4.1.

**Proof.** [Proof of Theorem 4.1] Suppose that \( H^0(C, \kappa) = 0 \). Then \( f^*(2D_\kappa) = \text{Div}(R_1 p_*(\text{End}_E(E) \otimes p_C^*\kappa)) \) over \( M_{\text{inv}}^{\text{geo}} \times C \) and \( p \) is the projection \( M_{\text{inv}}^{\text{geo}} \times C \to M_{\text{inv}}^{\text{geo}} \).

**Claim.** \( \text{Div}(R^1 f_*(\text{End}_E(E) \otimes p_C^*\kappa)^+) = \text{Div}(R^1 p_*(\text{End}_E(E) \otimes p_C^*(\kappa^{-1} \otimes K_C))^+)\).

**Proof.** [Proof of Claim] Grothendieck duality (cf. Chapter VII Theorem 3.3 in [7]) says that
\[ \mathbb{R}Hom_{M_{\text{inv}}^{\text{geo}} C/\mathbb{P}^1}(\mathbb{R}p_*(\text{End}_E(E) \otimes p_C^*\kappa), O_{M_{\text{inv}}^{\text{geo}} C/\mathbb{P}^1}) \to \mathbb{R}p_*(\text{End}_E(E) \otimes p_C^*(\kappa^{-1} \otimes K_C)) \]

is a quasi-isomorphism. Taking cohomologies, we obtain an isomorphism
\[ \text{Ext}^1_{O_{M_{\text{inv}}^{\text{geo}} C/\mathbb{P}^1}}(R^1 p_*(\text{End}_E(E) \otimes p_C^*\kappa), O_{M_{\text{inv}}^{\text{geo}} C/\mathbb{P}^1}) \to R^1 p_*(\text{End}_E(E) \otimes p_C^*(\kappa^{-1} \otimes K_C)). \]

Since this isomorphism is compatible with the \( i \)-action, we get an isomorphism
\[ \text{Ext}^1_{O_{M_{\text{inv}}^{\text{geo}} C/\mathbb{P}^1}}(R^1 p_*(\text{End}_E(E) \otimes p_C^*\kappa)^+, O_{M_{\text{inv}}^{\text{geo}} C/\mathbb{P}^1}) \to R^1 p_*(\text{End}_E(E) \otimes p_C^*(\kappa^{-1} \otimes K_C))^+. \]
\( \kappa^{-1} \otimes K_C \) and \( \kappa \) are isomorphic as line bundles on \( C \), but their \( i \)-actions differ by \((-1)\)-multiplication. Hence

\[
R^1 p_* (\text{End}^\partial (E) \otimes p_C^*(\kappa \otimes K_C))^+ \simeq R^1 p_* (\text{End}^\partial (E) \otimes p_C^\partial \kappa)^-.
\]

This isomorphism and the equality

\[
\text{Div} \left( R^1 p_* (\text{End}^\partial (E) \otimes p_C^\partial \kappa) \right) = \text{Div} \left( \text{Ext}^1 \left( R^1 p_* (\text{End}^\partial (E) \otimes p_C^\partial \kappa)^+, O_{\mathcal{M}^{\text{inv}}_{G/P^1}} \right) \right)
\]

implies the claim. \( \Box \)

This claim implies that

\[
\text{Div} \left( R^1 p_* (\text{End}^\partial (E) \otimes p_C^\partial \kappa) \right) = 2\text{Div} \left( R^1 p_* (\text{End}^\partial (E) \otimes p_C^\partial \kappa)^+ \right).
\]

This proves (i).

Suppose that \( H^0(C, \kappa) \neq 0 \). We shall show that \( H^0(C, \text{End}^\partial (E) \otimes \kappa) \neq 0 \) for any \( E \in \mathcal{M}_{G/P^1}^{\text{inv}} \), where \( \chi \left( \text{End}^\partial (E) \otimes O_C(V + (g-1-|V|)c_{2g+2})^+ \right) = (-g+1+|V|)/2 \neq 0 \), either \( H^0(C, \text{End}^\partial (E) \otimes O_C(V + (g-1-|V|)c_{2g+2}))^+ \) or \( H^1(C, \text{End}^\partial (E) \otimes O_C(V + (g-1-|V|)c_{2g+2}))^+ \) is nonzero. A similar argument as in the proof of the above claim implies that \( \dim H^0(C, \text{End}^\partial (E) \otimes O_C(V + (g-1-|V|)c_{2g+2})) = \dim H^0(C, \text{End}^\partial (E) \otimes O_C(V + (g-1-|V|)c_{2g+2})^+ + H^1(C, \text{End}^\partial (E) \otimes O_C(V + (g-1-|V|)c_{2g+2}))^+ \). Hence \( H^0(C, \text{End}^\partial (E) \otimes O_C(V + (g-1-|V|)c_{2g+2})) \neq 0 \). \( \Box \)

5. Reducedness of the divisors \( D_{(\mathfrak{A}, \lambda)} \). In this section, we shall show that the divisors \( D_{(\mathfrak{A}, \lambda)} \) are reduced.

For a non-negative integer \( l \), let \( Z_l \) be the closed subset of \( \mathcal{M}_{G/P^1}^{\text{inv}} \) consisting of involutively stable involtional vector bundle \( E \in \mathcal{M}_{G/P^1}^{\text{inv}} \) that satisfies

\[
\dim H^0(\text{End}^\partial (E) \otimes (\mathfrak{A} + \lambda c_{2g+2}))^+ \geq l.
\]

We give \( Z_l \) a scheme structure as follows. For some open neighborhood \( U \) of \( E \in Z_l \), we can take a resolution of involutional vector bundles

\[
0 \rightarrow \mathcal{G} \rightarrow O(-Nc_{2g+2}) \otimes V \rightarrow \text{End}^\partial (E) \otimes p_C^\partial O(\mathfrak{A} + \lambda c_{2g+2}) \rightarrow 0
\]

on \( U \times C \), where \( E \) is the universal involutional vector bundle (strictly speaking, only \( \text{End}^\partial (E) \) exists on \( \mathcal{M}_{G/P^1}^{\text{inv}} \times C \), \( N \) is a sufficiently large positive integer and \( V \) is a vector space with an \( i \)-action. This resolution gives rise to a short exact sequence

\[
0 \rightarrow R^1 p_* \mathcal{G}^+ \xrightarrow{p} R^1 p_* (O(-Nc_{2g+2}) \otimes V)^+ \rightarrow R^1 p_* (\text{End}^\partial (E) \otimes p_C^\partial O(\mathfrak{A} + \lambda c_{2g+2}))^+ \rightarrow 0,
\]

where \( p \) is the projection \( p : U \times C \rightarrow U \). By trivializing \( R^1 p_* \mathcal{G}^+ \) and \( R^1 p_* (O(-Nc_{2g+2}) \otimes V)^+ \) over an open neighborhood \( W \) of \( E \in \mathcal{M}_{G/P^1}^{\text{inv}} \), \( g \) can be expressed by an \( r \times r \) matrix \( \{ g_{ij} \} \) with \( g_{ij} \in O_{\mathcal{M}_{G/P^1}^{\text{inv}}} (W) \), where \( r = \text{rank} R^1 p_* \mathcal{G}^+ = \text{rank} R^1 p_* (O(-Nc_{2g+2}) \otimes V)^+ \). The ideal sheaf of \( Z_l \) is generated, over \( W \), by all the \( l \times l \) minors of this matrix. Note that, with this scheme structure, \( Z_1 \) is nothing but

\[
D_{(\mathfrak{A}, \lambda)}.
\]

For \( E \in \mathcal{M}_{G/P^1}^{\text{inv}} \), let \( \nu_E \) be the map

\[
H^0 (\text{End}^\partial (E) \otimes O(\mathfrak{A} + \lambda c_{2g+2}))^+ \otimes H^0 (\text{End}^\partial (E) \otimes K_C \otimes O(\mathfrak{A} + \lambda c_{2g+2})^{-1})^+
\rightarrow H^0 (\text{End}^\partial (E) \otimes K_C)^+.
\]
PROPOSITION 5.1. Assume that $|I|$ is even [resp. odd]. There exists a closed subset $\mathcal{Y}$ of $\mathcal{M}_{C,r}^{\text{inv}}$, of dimension at most $\left[\frac{4g-5}{3}\right]$ [resp. $\left[\frac{4g-7}{3}\right]$] such that if $E$ is not in $\mathcal{Y}$ then $\dim \ker \nu_E \leq l^2 - 2l + 1$, where $l = \dim H^0(C, \text{End}^E(E) \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^\ast$.

Proof. We give a proof for the case when $|I|$ is even. The case when $|I|$ is odd is very similar.

Suppose that $\dim \ker \nu_E > l^2 - 2l + 1$. Then we can find a non-zero element $\phi \otimes \psi$ in $\ker \nu_E$.

CLAIM 5.1.1. Either $\phi$ or $\psi$ is of rank one.

Proof. [Proof of Claim 5.1.1] For $c_j$, $1 \leq j \leq 2g+1$, fix an isomorphism $\alpha : \mathbb{C}^g \cong E \otimes C_j$, such that $\alpha(\mathfrak{t}(1,0))$ is, for the $i$-action, an even vector with the eigen value 1 and $\alpha(\mathfrak{t}(0,1))$ is an even vector with eigen value $-1$. With this trivialization, at $c_j$, $\phi$ and $\psi$ are expressed, respectively, by $(\begin{smallmatrix} 0 & b_1 \\ -b_1 & 0 \end{smallmatrix})$ and $(\begin{smallmatrix} 0 & b_2 \\ -b_2 & 0 \end{smallmatrix})$ with $b_1, b_2 \in \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})^{-1}$, and $a \in K_C \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})^{-1}$ if $c_j \in \mathfrak{A}$ because $\phi$ and $\psi$ are traceless and compatible with the $i$-action. The relation $\phi \circ \psi = \psi \circ \phi$ implies that $(\begin{smallmatrix} 0 & -ab \\ -ab & b_0 \end{smallmatrix}) = (\begin{smallmatrix} 0 & b_0 \\ -b_0 & 0 \end{smallmatrix})$. Hence either $\phi$ or $\psi$ is a zero map on the fiber over $c_j$. If $c_j \notin \mathfrak{A}$, switching the role of $\mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})$ and $K_C \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})^{-1}$, we know that $\phi$ or $\psi$ is zero map on the fiber over $c_j$. Therefore $\phi \circ \psi$ is a zero map on the fiber over $c_j$ for $1 \leq j \leq 2g+1$. If $\phi \circ \psi$ is injective, then $\deg E + 2(2g - 2) = \deg E \otimes K_C \geq \deg E + 2(2g + 1)$, which is a contradiction. Hence $\phi \circ \psi$ is not injective, which implies that either $\phi$ or $\psi$ is of rank one.

Without loss of generality we may assume that $\phi$ is of rank one. Put $L := \ker \phi$. Since $L$ is $i$-invariant, $L$ is isomorphic to $\mathcal{O}(\mathfrak{B} + \mu c_{2g+2})$, for some $\mathfrak{B} \subset \{c_1, \ldots, c_{2g+1}\}$ and $\mu \in \mathbb{Z}$, as involution bundles. $E/L$ is isomorphic to $\mathcal{O}(\mathfrak{B}' = (2g + 1 + \mu) c_{2g+2})$, where $\mathfrak{B}' := \{c_1, \ldots, c_{2g+1}\} \setminus \mathfrak{B}$.

CLAIM 5.1.2. We have $|\mathfrak{B}| + |\mathfrak{B}'| + \mu + \frac{1}{2} = g - 1 \geq 0$ if $H^0(C, \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^\ast = 0$. We have $|\mathfrak{B}| - |\mathfrak{B}'| + \mu - \frac{1}{2} = g - 1 \geq 0$ if $H^0(C, K_C \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^\ast = 0$.

Proof. [Proof of Claim 5.1.2] First note that either $H^0(C, \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^\ast$ or $H^0(C, K_C \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^\ast$ is zero because $H^0(C, \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^\ast = \max(\frac{1}{2} + 1, 0)$ and $H^0(C, K_C \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^\ast = \max(\frac{1}{2} - 1, 0)$.

If $H^0(C, \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^\ast = 0$, then $\phi$ induces a non-zero $i$-equivariant morphism $E/L \to L \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})$ because the composite $E/L \to E \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}) \to E/L \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})$ is zero. This nonzero $i$-equivariant morphism corresponds to a nonzero element of $H^0(C, L \otimes (E/L)^{-1} \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^\ast$. Since $H^0(C, L \otimes (E/L)^{-1} \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^\ast \simeq H^0(C, \mathcal{O}(\mathfrak{B} + \mathfrak{A} - \mathfrak{B}' + (2g + 1 + 2\mu + \lambda)c_{2g+2}))^\ast \simeq H^0(P^1, \mathcal{O}(|\mathfrak{B}| + |\mathfrak{B}'| + \mu + \frac{1}{2} - g - 1))$, we have $|\mathfrak{B}| + |\mathfrak{B}'| + \mu + \frac{1}{2} - g - 1 \geq 0$. Next we consider the case $H^0(C, K_C \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^\ast = 0$. Since $\phi \circ \psi \circ \phi$ and $L = \ker \phi$, the restriction of $\psi$ to $L$ factors through $L \otimes K_C \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2})^{-1}$, hence is a zero map because $H^0(C, K_C \otimes \mathcal{O}(\mathfrak{A} + \lambda c_{2g+2}))^\ast = 0$. This means that $L = \ker \psi$. Then a similar argument as above implies that $|\mathfrak{B}'| - |\mathfrak{B}| + \mu - \frac{1}{2} + g - 1 \geq 0$.

In order to complete the proof, it suffices to prove that $\dim H^1(C, \mathcal{H} \otimes \mathcal{O}(E/L, L))^\ast - 1 \leq \left[\frac{4g-5}{3}\right]$ because $H^1(C, \mathcal{H} \otimes \mathcal{O}(E/L, L))^\ast$ parameterizes extensions of $E/L$ by $L$ that are compatible with the $i$-actions. Since $H^1(C, \mathcal{H} \otimes \mathcal{O}(E/L, L))^\ast \simeq H^1(C, \mathcal{O}(\mathfrak{B} - \mathfrak{B}' + (2g + 1 + 2\mu)c_{2g+2}))^\ast \simeq$
$H^1(\mathbb{P}^1, \mathcal{O}(|\mathfrak{B}| + \mu - g - 1)), \dim H^1(C, \text{Hom}(E/L, L))^+ = \max\{g - \mu - |\mathfrak{B}|, 0\}$. By the above claim, $\dim H^1(C, \text{Hom}(E/L, L))^+ \leq \max\{\mathfrak{A} + \frac{\lambda}{2} - 1, 0\} \leq \lfloor \frac{g - 2}{2} \rfloor$. \[\square\]

Before stating and proving the main theorem of this section, we recall an important property of $\nu_E$.

**Proposition 5.2.** For $E \in Z_l \setminus Z_{l+1}$, the codimension of the irreducible component of $Z_l$ containing $E$ is greater than or equal to $\dim \nu_E$. If $\nu_E$ is injective, $Z_l$ is smooth at $E$ and of codimension $2^l$.

This proposition is essentially proved in [12] and we omit the proof.

**Theorem 5.3.** All the divisors $D_{(3, \lambda)}$ are reduced.

**Proof.** Note that the closed subset $Y$ of Proposition 5.1 is of codimension greater than one. Therefore we have only to prove that $D_{(3, \lambda)}|\mathcal{M}_{C/\mathbb{P}^1}^{CGP}| \setminus Y$ is reduced. For $E \in D_{(3, \lambda)} \setminus Y$, if $\dim H^0(C, \text{End}^+(E) \otimes \mathcal{O}(\mathfrak{A} + \lambda c_2g + 2))^+ = 1$, then by Proposition 5.1 $\nu_E$ is injective, hence $D_{(3, \lambda)}$ is smooth at $E$ by Proposition 5.2. Therefore if suffices to prove that codim $(Z_l \setminus Y, \mathcal{M}_{C/\mathbb{P}^1}^{CGP} \setminus Y) \geq 2$. For $E \in Z_2 \setminus Y$, $\dim \nu_E \geq 2l - 1$ by Proposition 5.1, where $l = \dim H^0(C, \text{End}^+(E) \otimes \mathcal{O}(\mathfrak{A} + \lambda c_2g + 2))^+$. By Proposition 5.2, the codimension of $Z_l$ at $E$ is greater than or equal to $2l - 1 > 2$. \[\square\]

**Acknowledgements.** I would like to express my gratitude to Professor Osamu Fujino, who kindly answered my question about singularities of moduli spaces. Lemma 2.8 is due to him. I would also like to thank the referee for the nice suggestions.
